

**Instructions for students**

- Write your Name and Roll No. at the top of the first pages of all problems.
- This examination paper consists of **37** pages of problems including answer boxes.
- Total marks for INChO 2014 paper are **98**.
- You have 3 hours to complete all the problems.
- Blank space for rough work has been provided at the end of the paper.
- **Use only a pen to write the answers in the answer boxes. Anything written by a pencil will not be considered for assessment.**
- All answers must be written in the appropriate boxes. Anything written elsewhere will not be considered for assessment.
- You must show the main steps in the calculations,
- Use only a non-programmable scientific calculator.
- For objective type question, mark **X** in the correct box. Some of the objective questions may have more than one correct answer.
- Values of fundamental constants required for calculations are provided on page 4.
- A copy of the Periodic Table of the Elements is provided at the end of the paper.
- Do not leave the examination room until you are directed to do so.
- The question paper will be uploaded on the HBCSE website by 4<sup>th</sup> February 2014.

**Problem 1****17 marks****Metallurgy**

Metallurgy is the technology of obtaining metals from their ores. Depending on the metal and the ore involved, metallurgical operations are divided into three broad divisions as hydrometallurgy, pyrometallurgy and electrometallurgy.

In hydrometallurgy, the metal is extracted into an aqueous solution using oxygen and a complexing agent. Hydrometallurgy is used for noble metals like silver and gold. The process is known as **leaching**. Potassium cyanide is traditionally used for extraction of gold.

In presence of air, native gold dissolves in a solution containing cyanide ions  $(\text{CN})^{-1}$  forming  $[\text{Au}(\text{CN})_2]^{-1}$ .

- 1.1 Write a balanced equation to represent dissolution of gold in KCN solution.

**(0.5 mark)**

- 1.2 Calculate the mass of KCN required to extract gold from 100 kg of a rock sample having 2.2% gold on w/w basis.

**(1 mark)**

Silver and gold both form cyanide complexes  $[\text{Ag}(\text{CN})_2]^{-1}$ ,  $[\text{Au}(\text{CN})_2]^{-1}$  with formation constants as  $4.2 \times 10^{20}$  and  $1.0 \times 10^{37}$  respectively.

1.3 Calculate the equilibrium constant for the reaction.

(0.5 mark)

1.4 Using 1.3 and the information given below, calculate the equilibrium concentrations of  $[\text{Au}(\text{CN})_2]^{-1}$  and  $[\text{Ag}(\text{CN})_2]^{-1}$  when solid gold is added in excess to 0.1M  $[\text{Ag}(\text{CN})_2]^{-1}$  solution. (under standard condition of temperature and pressure)

(2 marks)

Aqua regia is a mixture of concentrated hydrochloric acid and nitric acid in the ratio of 3:1 on volume basis. It was developed by the alchemists to dissolve gold. In the dissolution process, gold is oxidized and converted to a chloro complex and nitric acid gets reduced to nitrogen dioxide.

1.5 Write a balanced equation for the individual reactions.

(1 mark)

In pyro-metallurgy the metals are extracted from ores and concentrates by heat treatment. This involves conversion to metal oxide. This is followed by the reduction of the oxide to the metal using carbon or carbon monoxide. Metals like iron, copper, zinc and manganese are obtained by this technique.

**Ellingham diagram** is a graph showing the variation of the standard free energy of formation ( $\Delta G^\circ$ ) of metal oxides with temperature. The diagram also shows lines for formation of CO and CO<sub>2</sub>.

Ref: Shriver D.F. and Atkins P.W., *Inorganic Chemistry*, 2<sup>nd</sup> edition, ELBS, Oxford University Press, (1994), pg no. 278.

1.6 Using the **Ellingham diagram** given above answer the following. Mark **X** in the correct box.

- i) The equation of lines in the diagram is given by
- a)  $\Delta G = \Delta H - T\Delta S$
- b)  $\Delta G = \Delta H + T\Delta S$
- c)  $\Delta G^0 = \Delta H^0 - T\Delta S^0$
- d)  $\Delta G^0 = \Delta H^0 + T\Delta S^0$
- ii) The statement that is true for the line  $C \rightarrow CO_2$  is
- a) the standard entropy change of the above reaction is positive
- b) the standard entropy change of the above reaction is negative
- c) the standard entropy change of the above reaction is zero.
- iii) The statement that is true for the line  $CO \rightarrow CO_2$  is
- a) the standard entropy change of the above reaction is positive
- b) the standard entropy change of the above reaction is negative
- c) the standard entropy change of the above reaction is zero.
- iv) The **lowest** temperature below which FeO **cannot** be reduced by coke is
- a)  $750^\circ\text{C}$
- b)  $1300^\circ\text{C}$
- c)  $1000^\circ\text{C}$
- v) In a blast furnace at  $2000^\circ\text{C}$  the most preferred reaction that will take place for carbon containing species is
- a)  $C(s) + \frac{1}{2} O_2(g) \rightarrow CO(g)$
- b)  $\frac{1}{2}C(s) + \frac{1}{2}O_2(g) \rightarrow \frac{1}{2}CO_2(g)$
- c)  $CO(g) + \frac{1}{2} O_2(g) \rightarrow CO_2(g)$
- vi) The preferred temperature for Mg to be used as a reducing agent for  $SiO_2$  is
- a) below  $2200^\circ\text{C}$
- b) above  $2500^\circ\text{C}$
- c) not possible at any temperature

(4.5 marks)

In electrometallurgy, the pure metal is obtained by electrolysis of its appropriate salt.

Aluminum is produced from bauxite by electro-reduction of alumina. The process is known as **Hall- Herault's** process Alumina is dissolved in a conducting medium like cryolite  $\text{Na}_3\text{AlF}_6$ , as it cannot conduct electricity in the molten state. The temperature of melting of cryolite is reduced by adding conducting impurities to it. In the electrolytic bath, aluminum gets deposited at the cathode and oxygen gets liberated at the anode. The liberated oxygen attacks the graphite anode and forms carbon dioxide.

- 1.7 Write the balanced reactions involved in the electrolysis of alumina.

(1 mark)

The melting point of cryolite (molar mass 210 g) is 1282.7K. However, by adding sodium fluoride cryolite is made to melt at 1233K.

- 1.8 Calculate the percentage (on w/w basis) of sodium fluoride needed to be added to reduce the melting point to 1233K assuming that it dissociates completely. The heat of fusion of cryolite in this temperature range is  $114 \text{ kJ mol}^{-1}$ .

(3 marks)

The electrolysis is carried out with a potential difference of 4.5V between the two electrodes and the current passing through the cell is 180kA with the current efficiency of 95%.

- 1.9 i) Calculate the amount of energy required for production of 100kg of aluminum.

**(2 marks)**

- ii) Calculate the rate of production of carbon dioxide per hour.

**(1.5 marks)**

<b>Name of Student</b>	<b>Roll No</b>
------------------------	----------------

**Problem 2****15 Marks****Energy storage devices****A. Hydrogen storage as metal hydrides**

Hydrogen is a renewable source of energy and considered as a fuel of the future. One of the problems of its use is storage and transportation. Research has shown that several metal hydrides act as 'hydrogen tanks'. Large quantities of hydrogen can be absorbed on them and desorbed when needed through absorption/desorption cycles. Lithium nitride,  $\text{Li}_3\text{N}$  is one of the well studied hydrogen storage material. Almost all absorbed hydrogen can be subsequently desorbed if the hydrogenated sample of  $\text{Li}_3\text{N}$  is evacuated to 1 Pa and heated up to  $450^\circ\text{C}$ .

The hydrogen uptake of  $\text{Li}_3\text{N}$  is a chemical reaction in two steps. Both steps involve disproportionation of  $\text{H}_2$ .

2.1 Complete the following equations by identifying **A**, **B** and **C**.

**(1.5 marks)**

2.2 Under standard conditions of temperature and pressure, calculate the maximum volume of hydrogen that can be stored in 1kg of  $\text{Li}_3\text{N}$ .

--

**(1 mark)**

When a certain mass of compound **B** was reacted with excess amount of 0.5M HCl, a colourless gas was produced. Passing this gas over CuO(s) resulted in decrease in mass of the solid by 2.096 g.

- 2.3 (i) Write the balanced equation for the reaction of **B** with HCl  
(ii) Calculate the mass of **B** taken in grams.

(1 mark)

Mg and Mg<sub>2</sub>Ni also form hydrides which can be desorbed under suitable conditions of temperature and pressure. Mg<sub>2</sub>NiH<sub>4</sub> is formed by a technique known as hybridizing combustion synthesis. MgH<sub>2</sub> is synthesised by the reaction of H<sub>2</sub> and Mg at high temperatures and pressure in presence of a catalyst.

- 2.4 In Mg<sub>2</sub>NiH<sub>4</sub>, Ni(0) atoms form a face centered cubic lattice in which the Mg<sup>+2</sup> ions occupy interstitial positions. The unit cell length of Mg<sub>2</sub>NiH<sub>4</sub> was found to be  $6.465 \times 10^{-10}$  m.

A hydrogen cylinder at 20<sup>0</sup>C has number of moles of hydrogen per unit volume which is (1/100) times the number of moles of hydrogen present in unit volume of Mg<sub>2</sub>NiH<sub>4</sub>. Calculate the pressure (in bar) in this cylinder.

(2 marks)

The desorption equilibrium of  $\text{Mg}_2\text{NiH}_4$  is as given below

The equilibrium pressure of hydrogen was found to be 7.03 bar and 1.05 bar at 606K and 533K respectively. Assume that the enthalpy values do not change with temperature and  $\Delta H_f^\circ(\text{Mg}_2\text{NiH}_4) = -176.0 \text{ kJ mol}^{-1}$ .

2.5 Calculate the standard enthalpy change ( $\text{kJ mol}^{-1}$ ) for the reaction

(1.5 marks)

**B. Fuel cells – Green and renewable sources of energy**

Fuel cells convert the chemical energy of combustion in a fuel directly into electrical energy without the losses associated with the use of thermodynamic heat engines. A group of researchers have invented a fuel cell using cane sugar ( $\text{C}_{12}\text{H}_{22}\text{O}_{11}$ ). This system consists of two reaction vessels. The reaction vessel on the left hand side contains cane sugar and  $\text{VO}^{2+}$  ions in a strong acidic solution. Air is pumped in the right hand side vessel which also contains  $\text{VO}^{2+}$  ions in a strong acidic solution. The assembly contains a battery at the centre that is responsible to generate electricity.

In the left hand side vessel,  $\text{VO}^{2+}$  is reduced to  $\text{V}^{3+}$  and cane sugar is oxidised to  $\text{CO}_2$ . In the right hand side vessel,  $\text{VO}^{2+}$  is oxidised by oxygen to form  $\text{VO}_2^+$ . The fuel cell diagram is indicated below.

(Ref: Excell Robert H.B and Spaziante Placido (2004), A fuel power cell powered by sugar, The Joint International Conference on "Sustainable Energy and Environment, Thailand, 1-3 Dec 2004.)

- 2.6 Write balanced equations for all the reactions in the (a) left side reaction vessel  
(b) right side reaction vessel.

(2 marks)

- 2.7 Calculate the volume of air that has to be pumped in at 25°C and 101 kPa into the right side vessel, for the consumption of 10g of cane sugar in the other vessel (air contains 21 % of volume oxygen).

(1.5 marks)

2.8 Calculate the values of X and Y (in volts) from the given information.

(1 mark)

In the battery at the centre between the reaction vessels, the following half cell reactions take place during discharge

The standard reduction potentials are  $E^\circ(V^{3+}/V^{2+}) = 0.34 \text{ V}$  and  $E^\circ(VO_2^+/VO^{2+}) = 1.00 \text{ V}$  respectively. Assume that the concentration of  $V^{3+}(aq)$  and  $VO_2^+(aq)$  is equal to  $2.00 \text{ mol L}^{-1}$  (obtained from the reactions taking place in the reaction vessels).

2.9 Determine  $[V^{3+}]$ ,  $[VO_2^+]$  and  $[VO^{2+}]$  in the battery when the potential of the battery is  $0.32\text{V}$ . The temperature of the reaction vessel is  $25^\circ\text{C}$  throughout.

(2.5 marks)

**2.10** The standard Gibbs free energy change for the complete combustion of sucrose to carbon dioxide and water is  $-5684\text{kJ mol}^{-1}$ .

Calculate the theoretical limit on the efficiency of direct conversion of chemical energy in sugar to electricity by this method under standard conditions.

**Problem 3**

**25 marks**

**ALKALOIDS**

Alkaloids are naturally occurring nitrogen heterocycles. Although they are poisonous, when used in very small quantities they have medicinal value as well.

Alkaloid **A** (MF  $C_{17}H_{23}NO_3$ ) on hydrolysis with  $Ba(OH)_2$  yields two products **B** (MF  $C_9H_{10}O_3$ ) and **C** ( $C_8H_{15}NO$ ).

**3.1** Compound **B** does not add bromine and it dissolves in  $NaHCO_3$ . Heating **B** strongly yields compound **D** (MF  $C_9H_8O_2$ ). Based on these observations which of the following statement/s is/are true for compound **B**.

- a) **B** has a hydroxyl group
- b) **B** is an olefin
- c) **B** has a carboxyl group
- d) **B** is an aromatic compound

**(1.5 marks)**

**3.2** Compound **D** on oxidation gives benzoic acid as one of the products. Based on this observation, the possible structure/s for compound **D** is/ are

**(2 marks)**

- 3.3 Compound **B** has been synthesized by the following reaction sequence. Draw the structures of the intermediates **E-H** and the structure of **B**.

(Note: Product **H** is also obtained on treatment of **G** with HBr in the presence of  $\text{H}_2\text{O}_2$ )

(3 marks)

Structure elucidation of an alkaloid makes use of several chemical and physical methods. One of them is the Hoffman's exhaustive methylation method for determining the nature of the nitrogen heterocyclic ring. The heterocyclic ring is opened up with loss of nitrogen as an amine and formation of the less substituted olefin. The reactions involved are shown below.

(Note: A cyclic amine undergoes Hoffman's exhaustive methylation twice to give an amine and a diene).

3.4 Compound **C** does not decolorise bromine and dissolves in HCl. **C** on treatment with conc.  $H_2SO_4$  gives **J**. Hoffman's exhaustive methylation of compound **J** gives 1, 3, 5-cycloheptatriene as one of the products. The possible structure /s for compound **C** is /are

(3 marks)

3.5 Compound **C** on controlled oxidation gives a compound **K** which gives a yellow precipitate with 2,4-DNP and also reacts with two equivalents of benzaldehyde in the presence of a base to give a dibenzylidene derivative, the general structure of such derivatives is shown below.

The possible structure /s for compound **C** based on the above observations is /are

(2 marks)

3.6 i) Write the number of chiral atoms in **a** and **b** in 3.5.

(1 mark)

ii) For the structures **a-e** in 3.5 the compounds that are optically active are (Mark X in the correct box)

a	b	c	d	e
<input type="checkbox"/>				

(1 mark)

Oxidation of **C** with  $\text{CrO}_3$  gives dibasic acid **L**. **L** on heating with HI at  $150\text{-}300^\circ\text{C}$  gives one mole of methyl iodide.

3.7 0.580 g of **L** is dissolved in  $100\text{cm}^3$  of distilled water.  $10\text{cm}^3$  of this diluted solution required  $6.2\text{cm}^3$  of 0.1 N KOH for neutralisation. Determine the molecular mass of **L**. Show all the steps in the calculation.

(1 mark)

3.8 Write the molecular formula of compound **L**.

(1 mark)

3.9 Oxidation of **L** gives one of the products as **M**. Draw the structure of **L**.

**M**

**L**

(1 mark)

3.10 Draw the possible tautomeric structure/s of **M**.

(1 mark)

3.11 Based on all the observations from 3.4 -3.9 the structure of C is

(1 mark)

3.12 Draw the possible structure for alkaloid A.

(1 mark)

In plant metabolism alkaloids are formed from amino acids. Alkaloid hygrine (N) is formed in nature from amino acid Ornithine (O)

N

O

The first step in the synthesis is the pyridoxal catalysed decarboxylation of Ornithine.

3.13 Identify the missing intermediate **Q**.

**R**

(1 mark)

3.14 Identify S, T, U and V in the following sequence.

**\*\*Note: Methylation using SAM takes place at the more nucleophilic nitrogen.**

**(3.5 marks)**

3.15 Biosynthetic pathways are usually established by isotopic labeling of potential precursors. If ornithine is labeled with  $^{14}\text{C}$  at  $\text{C}_2$  and  $^{15}\text{N}$  at nitrogen on  $\text{C}_2$ , draw the structure of the hygrine obtained indicating the labeled atoms.

**Problem 4****15 marks****Applications of Transition Metal Complexes**

The transition metals are widely distributed in earth's crust. The elements Co, Ir belong to Group IX of the periodic table. These elements as well as their compounds have several applications in chemistry. Cobalt and its compounds are used as catalysts and in making alloys, pigments and glasses.

Silica, on doping with an aqua complex of Co(II) shows light pink colour in wet condition and deep blue colour in dry condition. This colour change is associated with the structural changes in the complex of Co(II) due to partial loss of water.

- 4.1 Write the formula of the aqua complex of Co(II) that has pink colour.

**(0.5 mark)**

- 4.2 With the above formula, write the balanced chemical equation for the reaction responsible for the observed colour change.

**(1 mark)**

Mercuric tetrathiocyanatocobaltate (II) is another complex of cobalt, used as a standard for calibrating magnetic balances. Its spin only magnetic moment is 3.872 Bohr magnetons.

- 4.3 Write the formula of the complex.

**(0.5 mark)**

- 4.4 Based on the magnetic moment **alone**, can the structure of the complex in 4.3 be predicted correctly to be tetrahedral or square planar?

Yes  No

**(1 mark)**

- B.** An oxide of cobalt,  $\text{Co}_3\text{O}_4$  can exist **either**
- (a) as a normal spinel  $\text{Co}^{\text{II}}(\text{Co}_2^{\text{III}}\text{O}_4)$  where  $1/8^{\text{th}}$  of the tetrahedral holes are occupied by  $\text{Co}^{\text{II}}$  ions and  $1/4^{\text{th}}$  of the octahedral holes are occupied by  $\text{Co}^{\text{III}}$  ions in a cubic lattice, **or**
- (b) as an inverted spinel where  $1/4^{\text{th}}$  of  $\text{Co}^{\text{II}}$  and  $\text{Co}^{\text{III}}$  exchange their sites.

	Pairing energy $P(\text{cm}^{-1})$	$\Delta_0(\text{cm}^{-1})$	$\Delta_t(\text{cm}^{-1})$
$\text{Co}^{3+}$	20680	20760	9226
$\text{Co}^{2+}$	20800	9200	4090

( $\Delta_0$  and  $\Delta_t$  imply the octahedral and tetrahedral splitting parameters respectively for oxygen as the ligand)

- 4.5** On the basis of the above data, calculate the crystal field stabilization energy (CFSE) in  $\text{kJ mol}^{-1}$  for
- i) a) cobalt (III) in octahedral and b) cobalt (III) in tetrahedral sites.
- ii) a) cobalt (II) in octahedral and b) cobalt (II) in tetrahedral sites

**(In actual calculations of CFSE values neglect the pairing energies)**

**(3 marks)**

4.6 Calculate the difference of the CFSE values obtained in 4.5 i) and 4.5 ii).

cobalt (III) in octahedral and tetrahedral sites

cobalt (II) in octahedral and tetrahedral sites

(1 mark)

## Chemistry of Carbohydrates

Carbohydrates are biomolecules which perform diverse functions such as being energy sources and constituents of nucleic acids. In solution, monosaccharides, the simplest unit of carbohydrates, exist in cyclic hemiacetal form. The cyclic form is in equilibrium with small quantity of the open chain form.

In a trivial system of naming (D,L-system), the carbohydrates having the configuration at the asymmetric carbon of highest number same as that of R-glyceraldehyde (shown below) are called D forms while those having opposite configuration at the same carbon are called L-forms.

R-glyceraldehyde

Monosaccharides **A**, **B** and **C** have the following structures.

5.1 Classify sugars **A**, **B** and **C** into D or L forms.

**A**

**B**

**C**

(1.5 marks)

Some terms and their abbreviations are given below.

Term	Identical	Enantiomer	Diastereomer
Abbreviation	I	E	D

- 5.2 i) Which is the correct term to describe the relationship of each of the following structure with A? (Mark X in the correct box)

I	E	D

I	E	D

I	E	D

(3 marks)

- 5.3 a) Some reactions of a monosaccharide **U** are given below. Complete them by drawing the structures of the products with correct stereochemistry wherever applicable.

**U**

(2.5 marks)

- b) Monosaccharide **U** react with phenylhydrazine in excess to yield a crystalline derivative called osazone.

Another aldose **V** and ketose **W** also give the same osazone as **U** on reaction with excess of phenylhydrazine. Draw the structure of **V** and **W** in the Fischer projection formula.

(1.5 marks)

1,2 – or 1,3 – diols can be protected by forming cyclic acetals with one equivalent of acetone in acidic conditions. These acetals are hydrolysed back to the original hydroxyl groups in dilute acid solutions.

5.4 Draw the structure of the product **G** in the following reaction.

Compound **N** is a vital nutrient essential for the proper growth of the human body. It is commercially synthesized from monosaccharide **H**.

5.5 Draw the structure of the product **I** (with correct stereochemistry) in the first step of the synthesis of **N**.

**I** undergoes microbial oxidation to give **J** whose structure is given as follows

5.6 In the conversion of **I** to **J**, which carbon of the original **H** is undergoing this oxidation? (Mark X in the correct box).

C1	C2	C3	C4	C5	C6

(1 mark)

5.7 Complete the synthesis of **N** by drawing structures for **J'**, **K**, **L** and **M** with correct stereochemistry.

(3.5 marks)

Monsaccharides and oligosaccharides that have a free – OH group on the anomeric carbon give a positive test for Tollen’s reagent. Such sugars are called reducing sugars. If this free–OH group at the anomeric carbon is replaced by an ether then the result is a glycoside. The nonsugar part of a glycoside is called an aglycone. Both glycosides and oligosaccharides can be hydrolysed by acids or enzymes into their components.

A disaccharide **O** ( $C_{12}H_{22}O_{11}$ ) is reducing in nature. On hydrolysis by enzyme emulsin (which cleaves only  $\beta$  linkages) **O** gives **H** as the only product.

**O** undergoes the following reactions.

5.8 From the structures of **Q** and **R** draw the structure of **O**.

(2 marks)

A glycoside **S** on careful hydrolysis with emulsin gives the disaccharide **O** and the aglycone **T** whose structure is shown below

5.9 Draw the structure of the glycoside **S** with the correct stereochemistry.

**Problem 6****8 marks****Chemical equilibria in quantitative analysis**

- A. Many metal ions can be precipitated from their aqueous solutions as sulphides using hydrogen sulphide, a weak dibasic acid. The concentration of the sulphide ions in the solution can be controlled by adjusting the pH of the solution and thus the separation of the metal ions from the mixture can be achieved.

Relevant data needed for calculations in different subparts is presented below.

Dissociation constants of  $\text{H}_2\text{S}$ :

$$K_1 = 1 \times 10^{-9} \text{ and } K_2 = 1.3 \times 10^{-14}$$

Salt	CdS	$\text{Tl}_2\text{S}$
Solubility product ( $K_{sp}$ )	$1.0 \times 10^{-27}$	$6.0 \times 10^{-22}$

- 6.1 Solid NaOH is added to 1L of 0.05M solution of  $\text{H}_2\text{S}$  until the pH reached the value of 12.0. Calculate-
- Initial pH of  $\text{H}_2\text{S}$  solution before the addition of solid NaOH.
  - Concentration of all the species at pH =12.0 (Use appropriate approximations).
  - Total mass of solid NaOH added to the solution.

**(3 marks)**

A sample solution contains 0.003M each of  $\text{Cd}^{+2}$  ions and  $\text{Tl}^{+1}$  ions. The mixture needs to be separated using  $\text{H}_2\text{S}$  at appropriate pH. The separation is assumed to be quantitatively complete when the concentration of  $\text{Cd}^{+2}$  ions in the sample solution becomes  $1 \times 10^{-6}$  of the initial value.

- 6.2 Calculate the optimal pH range in which  $\text{Cd}^{+2}(\text{aq})$  and  $\text{Tl}^{+1}(\text{aq})$  can be separated quantitatively. (The  $\text{H}_2\text{S}$  concentration in this solution is 0.10 M).

- B.** Volhard method is a back titration method and involves excess addition of  $\text{AgNO}_3$  and its back titration with potassium thiocyanate using ferric alum as the indicator. The end point is the appearance of a reddish brown colour due to the formation of iron thiocyanate complex.
- 6.3** 10g of pesticide sample containing arsenic was treated appropriately to convert its arsenic content to  $\text{AsO}_4^{3-}$ . Then 25mL of 0.045M  $\text{AgNO}_3$  was added to precipitate  $\text{AsO}_4^{3-}$  as  $\text{Ag}_3\text{AsO}_4$ . The precipitate was filtered and the **unreacted**  $\text{AgNO}_3$  present in the filtrate was then titrated with 0.05M potassium thiocyanate. The observed titre value was 5.0 mL. Calculate the percentage of arsenic as  $\text{AsO}_4^{3-}$  in the pesticide sample.
