

## FINAL PAPER

## PART A

1996

## AUSTRALIAN CHEMISTRY OLYMPIAD

Please note that this answer book will be photocopied when returned and then split so that answers are sent to the appropriate markers. For this reason it is extremely important that you observe instructions 5 to 7.

## Instruction to candidates

(1) You are allowed 10 minutes to read this paper, and $31 / 2$ hours to complete the questions.
(2) You are not permitted to refer to books, notes or periodic tables but you may use a non programmable electronic calculator and molecular models.
(3) You must attempt questions 1, 2 and 3. In the Organic section you must attempt Q4 along with 2 other questions of your choice.
(4) Answers must provide clearly laid out working and sufficient explanation to show how you reached your conclusions.
(5) Answers must be written in the blank space provided immediately below each question in the exam booklet. Rough working must be on the backs of pages. Only material presented in the answer boxes will be assessed.
(6) Your name must be written in the appropriate place on each page of your answers.
(7) Use only black or blue ball point pen for your written and drawn answers, pencil or other coloured pens are not acceptable.

## Question 1

In an in vivo study of the action of ethanol dehydrogenase (an enzyme that destroys ethanol in the liver), volunteers drank vodka until their blood alcohol level stabilised. They then stopped drinking, and their blood alcohol content was monitored over time. In one particular subject, the following data were recorded.

| Time (min) | [EtOH] (\% by vol.) |
| :--- | :--- |
| 0 | 0.0507 |
| 20 | 0.0426 |
| 40 | 0.0374 |
| 60 | 0.0305 |
| 90 | 0.0213 |
| 120 | 0.0150 |
| 150 | 0.0104 |
| 180 | 0.0070 |
| 210 | 0.0048 |
| 240 | 0.0034 |

a) Graph $[\mathrm{EtOH}]$ vs time on the paper provided. What is the order in $[\mathrm{EtOH}]$ for the first hour of the experiment?
b) By making one or more extra plots (on the same paper), determine the order in [EtOH] during the last hour of the experiment.
c) What are the relevant (pseudo) rate constants for each regime? (Molar mass of ethanol $=46.1 \mathrm{~g} / \mathrm{mol}$; density of ethanol $=0.785 \mathrm{~g} / \mathrm{mL}$ )

Next, some in vitro studies were conducted. The enzyme was isolated, and an aqueous solution of $1.0 \mathrm{~g} / \mathrm{L}$ made up. The pressure required to prevent osmosis against pure water was found to be 43 Pa at $25^{\circ} \mathrm{C}$. After buffering to an appropriate pH and the addition of co-factors, the solution was warmed, and ethanol added. The rate of reaction was determined by infrared spectroscopy of the aldehyde formed. The following data were obtained.

| Temperature $\left({ }^{\circ} \mathbf{C}\right.$ ) | Rate ( $\mathbf{m o l}^{\mathbf{- 1}} \mathbf{L}^{\mathbf{- 1}}$ ) |
| :--- | :--- |
| 35 | $6.3 \times 10^{-4}$ |
| 36 | $6.8 \times 10^{-4}$ |
| 37 | $7.3 \times 10^{-4}$ |
| 38 | $8.0 \times 10^{-4}$ |
| 39 | $8.5 \times 10^{-4}$ |

d) What is the molar mass of ethanol dehydrogenase?
e) What is the activation energy of the rate-determining step of the reaction?

## Question 2

(a) With the aid of clearly labelled diagrams illustrate the orbitals and hybrid orbitals used to account for the shapes and bonding in any three of the following:
(i) $\mathrm{NF}_{3}$
(ii) $\mathrm{ICl}_{4}^{-}$
(iii) $\mathrm{C}_{6} \mathrm{H}_{6}$
(iv) $\mathrm{NO}_{3}^{-}$
(b) Explain by use of the VSEPR model why the bond angle of $\mathrm{NF}_{3}$ is $102.5^{\circ}$ and in $\mathrm{NH}_{3}$ is $107^{\circ}$ while the bond angle in $\mathrm{PF}_{3}$ is $96.3^{\circ}$ and in $\mathrm{PH}_{3}$ is $93.6^{\circ}$.
(c) Draw and name all the possible stereoisomers of $\left[\mathrm{CoCl}(\mathrm{NCS})(\mathrm{en})_{2}\right]$ Br. What other types of isomerism could be exhibited by the complex? Give an example of each type and name the isomer.
(d) The oxides $\mathrm{TiO}, \mathrm{CoO}, \mathrm{MnO}, \mathrm{NiO}$ and FeO all have the rock salt or sodium chloride structure.
(i) What is the stereochemistry of the metal ion in each of these compounds? Draw a clearly labelled crystal field d-orbital splitting diagram for each of the metal ions in these oxides and determine the crystal field stabilisation energy (CFSE) in terms of $\Delta_{0}$.
(ii) Which of these oxides would be expected to be the most stable? Explain.
(iii) Would CuO be expected to adopt a similar structure? Explain.

## Question 3

(a)

Calculate the equilibrium constant for the reaction

$$
2 \mathrm{MnO}_{4}^{-}+3 \mathrm{Mn}^{2+}+2 \mathrm{H}_{2} \mathrm{O} \longrightarrow 5 \mathrm{MnO}_{2}(\mathrm{~s})+4 \mathrm{H}^{+}
$$

given the following standard reduction potentials

$$
\begin{array}{ll}
\mathrm{MnO}_{4}^{-}+4 \mathrm{H}^{+}+3 \mathrm{e}^{-} \longrightarrow \mathrm{MnO}_{2}(\mathrm{~s})+2 \mathrm{H}_{2} \mathrm{O} & \mathrm{E}^{\circ}=+1.695 \mathrm{~V} \\
\mathrm{MnO}_{2}(\mathrm{~s})+4 \mathrm{H}^{+}+2 \mathrm{e}^{-} \longrightarrow \mathrm{Mn}^{2+}+2 \mathrm{H}_{2} \mathrm{O} & \mathrm{E}^{\circ}=+1.23 \mathrm{~V}
\end{array}
$$

(b) The $\mathrm{FeSCN}^{2+}$ complex is strongly coloured in solution when its concentration exceeds $10^{-5} \mathrm{M}$. However, the complex is not very stable, dissociating according to:
$\mathrm{FeSCN}^{2+} \longrightarrow \mathrm{Fe}^{3+}+\mathrm{SCN}^{-} \quad$ with dissociation constant $\mathrm{K}_{\mathrm{D}}=10^{-2} \mathrm{M}$.
(i) $10^{-3} \mathrm{~mol}$ of $\mathrm{FeCl}_{3}$ and $10^{-2} \mathrm{~mol}$ of KSCN are dissolved in one litre of water. Show that the solution will be coloured.
(ii) Fluoride ions form a colourless complex with ferric ions:

$$
\mathrm{Fe}^{3+}+\mathrm{F}^{-} \longrightarrow \mathrm{FeF}^{2+} \quad \mathrm{K}=10^{5} \mathrm{M}^{-1}
$$

What mass of KF must be added to the solution in part (i) to remove the colour? (Atomic masses: $\mathrm{K}=39.10, \mathrm{~F}=19.00 \mathrm{~g} / \mathrm{mol}$ )
(c) $\quad \mathrm{A} 50.00 \mathrm{~mL}$ aliquot of 0.0500 M NaCN is titrated (carefully!) with 0.1000 M HCl . $\mathrm{K}_{\mathrm{a}}(\mathrm{HCN})=6.2 \times 10^{-10}$
Construct the titration curve on the graph paper provided ( Y -axis $=\mathrm{pH} ; \mathrm{X}$-axis $=$ volume of HCl titrant) by calculating the pH after the addition of:
(i) 0.00 mL HCl
(ii) 10.00 mL HCl
(iii) 25.00 mL HCl
(iv) 26.00 mL HCl

## Organic Section

Students must attempt Question 4 and any 2 other questions of their choice in this section. Students should spend $\sim 45$ minutes on this section.

## Question 4

(a) The enantiomers of 1-amino-2-propanol were separated and recovered as their hydrochloride salts:

The samples of $(R)-(-)$-1-amino-2-propanol hydrochloride had $[\alpha]_{D}^{25}-31.5^{\circ}$ (c 0.01 ; methanol) and that of $(S)-(+)$-1-amino-2-propanol hydrochloride had $[\alpha]_{D}^{25}+35^{\circ}$ (c 0.01 ; methanol)
(i) Write correct stereochemical formulas for the levorotatory and dextrorotatory isomers.
(ii) Assuming that the optical rotation observed for the enantiomer of higher purity is the correct optical rotation for the compound, what is the enantiomeric excess in the sample of the other enantiomer?
(b) The stereochemical requirements for the E2 elimination reaction were explored using alkyl halides labelled with deuterium atoms. 2-Bromo-3-deuterobutane was used in two isomeric forms. The products observed in each case are outlined below.
1.

(E)-2-butene + with no deuterium 30\%
(Z)-2-butene + with one deuterium 34\%

1-butene with one deuterium $35 \%$
2.

$\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{O}^{-} \mathrm{K}^{+}$
ethanol
$70^{\circ} \mathrm{C}$
(E)-2-butene + with one deuterium 58\%
(Z)-2-butene with no deuterium with one deuterium $13 \%$
(i) Using Fischer projections with methyl groups arranged on the vertical axis, draw stereochemically accurate representations of $(2 S, 3 R)$ - and ( $2 S, 3 S$ )-2-bromo-3deuterobutane.
(ii) Using saw-horse diagrams show the transition states for the reactions leading to ( $E$ )-2-butene and ( $Z$ )-2-butene in each case.

## Question 5

(a) The following would be expected to produce the bromohydrin shown below on the left. However, the reaction actually gives the allylic bromide on the right.

(i) What are the structures for the two different bromonium ion intermediates that could result from the reaction of the alkene with bromine?
(ii) Only one of the bromonium ions is proposed to form in this reaction. Which one is it, and what is wrong with the other one?
(iii) Write a mechanism that rationalises the formation of the allylic bromide from the bromonium ion that you selected as the one that forms in the reaction.
(b) The following reaction was used in the synthesis of (+)-asteriscanolide, a natural product.

(i) What reagents would you use for this transformation?

## Question 6

(a)

When 2,2-dimethylcyclohexanol is treated with acid, 1,2- dmethylcyclohexene and isopropylidenecyclopentane are the products obtained. Draw a detailed mechanism that explains this result.

(b)

Imines behave toward Grignard reagents in much the same way that carbonyl groups do. The following transformations were carried out.

(i) Supply the necessary reagents to complete the transformation.
(ii) Give a reason for why the reaction with $\mathbf{B}$ is done at $-78^{\circ}$.

## Question 7

## Either

(a) Gilbert Stork of Columbia University discovered that enamines, nitrogen-containing compounds that are analogous to enolate anions, can be used as sources of nucleophilic carbon atoms in syntheses. The following equations show the preparation and reactions of an enamine. Provide a mechanism for each step.

pyrrolidine enamine of cyclohexanone ~85\%

Or
(b) Write a complete mechanism for the following reaction.

## Question 8

(a) Compound $\mathbf{A}$, which is a degradation product of the antibiotic vermiculine (see below), has the following structure,

The structure was confirmed by converting $\mathbf{A}$ to compound $\mathbf{B}, \mathrm{C}_{11} \mathrm{H}_{18} \mathrm{O}_{4}$, which was also prepared by ozonolysis of compound $\mathbf{C}, \mathrm{C}_{11} \mathrm{H}_{18} \mathrm{O}_{2}$.

Assign structures to compounds $\mathbf{B}$ and $\mathbf{C}$.

(b) Reactions of cis-4,5-dimethylcyclohexene and 3-tert-butylcyclohexene with $m$-chloroperoxybenzoic acid give predominately one product in each case. Show the conformation of each starting alkene, and predict, by showing the reaction with the peroxyacid, what the structure of the expected product should be.

## Question 9

(a) Reaction of phenol with acetone in the presence of an acid catalyst gives a compound known as bisphenol A. Bisphenol A is used in the production of epoxy resins and polycarbonate resins. Propose a mechanism for the formation of bisphenol A.

(b) 5-Fluoro-2-methyl-1-indanone is an intermediate in the synthesis of sulindac (Clinoril), a nonsteroidal anti-inflammatory drug (NSAID) used for the treatment of rheumatoid arthritis, osteoarthritis, and gout. It is formed by treatment of fluorobenzene with 2-bromo-2methylpropanoyl bromide in the presence of aluminium chloride. Propose a mechanism for this transformation.
