

# 2001 U. S. NATIONAL CHEMISTRY OLYMPIAD NATIONAL EXAM—PART II 

Prepared by the American Chemical Society Olympiad Examinations Task Force

# OLYMPIAD EXAMINATIONS TASK FORCE 

Arden P. Zipp, State University of New York, Cortland, NY Chair<br>Jo A. Beran, Texas A\&M University-Kingsville, TX<br>Peter E. Demmin (retired), Amherst Central High School, NY<br>Edward DeVillafranca (retired), Kent School, CT<br>Dianne H. Earle, Paul M. Dorman High School, SC<br>Alice Johnsen, Bellaire High School, TX<br>Patricia A. Metz, United States Naval Academy, MD<br>Ronald O. Ragsdale, University of Utah, UT<br>Diane D. Wolff, Western Virginia Community College, VA

## DIRECTIONS TO THE EXAMINER-PART II

Part II of this test requires that student answers be written in a response booklet of blank pages. Only this "Blue Book" is graded for a score on Part II. Testing materials, scratch paper, and the "Blue Book" should be made available to the student only during the examination period. All testing materials including scratch paper should be turned in and kept secure until April 22, 2001, after which tests can be returned to students and their teachers for further study.
Allow time for the student to read the directions, ask questions, and fill in the requested information on the "Blue Book". When the student has completed Part II, or after one hour and forty-five minutes has elapsed, the student must turn in the "Blue Book", Part II of the testing materials, and all scratch paper. Be sure that the student has supplied all of the information requested on the front of the "Blue Book," and that the same identification number used for Part I has been used again for Part II.
There are three parts to the National Olympiad Examination. You have the option of administering the three parts in any order, and you are free to schedule rest-breaks between parts.

| Part I | 60 questions | single-answer multiple-choice | 1 hour, 30 minutes |
| :--- | :--- | :--- | :--- |
| Part II | 8 questions | problem-solving, explanations | 1 hour, 45 minutes |
| Part III | 2 lab problems | laboratory practical | 1 hour, 30 minutes |

A periodic table and other useful information are provided on the back page for student reference. Students should be permitted to use non-programmable calculators.

## DIRECTIONS TO THE EXAMINEE-PART II

DO NOT TURN THE PAGE UNTIL DIRECTED TO DO SO. Part II requires complete responses to questions involving problem-solving and explanations. One hour and forty-five minutes are allowed to complete this part. Be sure to print your name, the name of your school, and your identification number in the spaces provided on the "Blue Book" cover. (Be sure to use the same identification number that was coded onto your Scantron® sheet for Part I.) Answer all of the questions in order, and use both sides of the paper. Do not remove the staple. Use separate sheets for scratch paper and do not attach your scratch paper to this examination.

When you complete Part II (or at the end of one hour and forty-five minutes), you must turn in all testing materials, scratch paper, and your "Blue Book." Do not forget to turn in your U.S. citizenship statement before leaving the testing site today.

1. $(10 \%)$ The mass percent of $\mathrm{MnO}_{2}$ in a sample of a mineral is determined by reacting it with a measured excess of $\mathrm{As}_{2} \mathrm{O}_{3}$ in acid solution, and then titrating the remaining $\mathrm{As}_{2} \mathrm{O}_{3}$ with standard $\mathrm{KMnO}_{4}$. A 0.225 g sample of the mineral is ground and boiled with 75.0 mL of $0.0125 \mathrm{M} \mathrm{As}_{2} \mathrm{O}_{3}$ solution containing 10 mL of concentrated sulfuric acid. After the reaction is complete, the solution is cooled, diluted with water, and titrated with $2.28 \times 10^{-3} \mathrm{M} \mathrm{KMnO}_{4}$, requiring 16.34 mL to reach the endpoint. Note: 5 mol of $\mathrm{As}_{2} \mathrm{O}_{3}$ react with 4 mol of $\mathrm{MnO}_{4}^{-}$.
a. Write a balanced equation for the reaction of $\mathrm{As}_{2} \mathrm{O}_{3}$ with $\mathrm{MnO}_{2}$ in acid solution. The products are $\mathrm{Mn}^{2+}$ and $\mathrm{AsO}_{4}{ }^{3-}$.
b. Calculate the number of moles of
i. $\mathrm{As}_{2} \mathrm{O}_{3}$ added initially.
ii. $\mathrm{MnO}_{4}^{-}$used to titrate the excess $\mathrm{As}_{2} \mathrm{O}_{3}$.
iii. $\mathrm{MnO}_{2}$ in the sample.
c. Determine the mass percent of $\mathrm{MnO}_{2}$ in the sample.
d. Describe how the endpoint is detected in the $\mathrm{KMnO}_{4}$ titration.
2. $(15 \%)$ The presence of $\mathrm{CO}_{3}{ }^{2-}, \mathrm{HCO}_{3}{ }^{-}$and $\mathrm{CO}_{2}$ in body fluids helps to stabilize the pH of these fluids despite the addition or removal of $\mathrm{H}^{+}$ions by body processes. Answer the following questions about solutions containing these species in varying combinations at $25^{\circ} \mathrm{C}$. $K_{1}$ and $K_{2}$ for $\mathrm{H}_{2} \mathrm{CO}_{3}$ are $4.2 \times 10^{-7}$ and $4.7 \times 10^{-11}$, respectively.
a. Write balanced equations to represent the processes responsible for $K_{1}$ and $K_{2}$.
b. Calculate the $\left[\mathrm{H}^{+}\right]$and pH expected for
i. 0.033 M solution of $\mathrm{H}_{2} \mathrm{CO}_{3}$, which is the saturation point of $\mathrm{CO}_{2}$ at $25^{\circ} \mathrm{C}$.
ii. $1: 1$ mixture of $\mathrm{H}_{2} \mathrm{CO}_{3}$ and $\mathrm{HCO}_{3}^{-}$.
iii. $1: 1$ mixture of $\mathrm{HCO}_{3}^{-}$and $\mathrm{CO}_{3}{ }^{2-}$.
iv. 0.125 M solution of $\mathrm{CO}_{3}{ }^{2-}$.
c. The "normal" pH in blood plasma is 7.40 . Identify the components that would provide the best buffer at this pH and calculate their ratio.
d. The value of $K_{1}$ is based on the assumption that all of the $\mathrm{CO}_{2}$ dissolved in water exists in the form of $\mathrm{H}_{2} \mathrm{CO}_{3}$. However, recent evidence suggests that an additional equilibrium exists as represented by this equation.

$$
\mathrm{CO}_{2}(a q)+\mathrm{H}_{2} \mathrm{O}(l) \rightleftharpoons \mathrm{H}_{2} \mathrm{CO}_{3}(a q)
$$

When the "true" concentration of $\mathrm{H}_{2} \mathrm{CO}_{3}(a q)$ is taken into account, $K_{1}=2 \times 10^{-4}$. Use this information to determine the percent of dissolved $\mathrm{CO}_{2}$ that is actually present as $\mathrm{H}_{2} \mathrm{CO}_{3}(a q)$.
3. $(12 \%)$ Glucose, $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$, is readily metabolized in the body.
a. Write a balanced equation for the metabolism of $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}$ to $\mathrm{CO}_{2}$ and $\mathrm{H}_{2} \mathrm{O}$.
b. Calculate $\Delta G_{\text {metabolism }}^{\mathrm{o}}$ for glucose. Given: The free energy of formation, $\Delta G_{f}^{\circ}$, is $-917 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$ for $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}(s)$; $-394.4 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$ for $\mathrm{CO}_{2}(\mathrm{~g}) ;-237.2 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}$ for $\mathrm{H}_{2} \mathrm{O}(l)$.
c. If $\Delta H^{\circ}$ for this process is -2801.3 kJ , calculate $\Delta S^{\circ}$ at $25^{\circ} \mathrm{C}$.
d. One step in the utilization of energy in cells is the synthesis of ATP ${ }^{4-}$ from ADP $^{3-}$ and $\mathrm{H}_{2} \mathrm{PO}_{4}^{-}$, according to this equation.

$$
\mathrm{ADP}^{3-}+\mathrm{H}_{2} \mathrm{PO}_{4}^{-} \rightarrow \mathrm{ATP}^{4-} \quad \Delta G^{\mathrm{o}}=30.5 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}
$$

i. Calculate the number of moles of ATP ${ }^{4-}$ formed by the metabolism of 1.0 g of glucose.
ii. Calculate the equilibrium constant, $K$, for the formation of ATP ${ }^{4-}$ at $25^{\circ} \mathrm{C}$.
4. $(11 \%)$ The corrosion of iron is an electrochemical process that involves the standard reduction potentials given here at $25^{\circ} \mathrm{C}$.

$$
\begin{array}{ll}
\mathrm{Fe}^{2+}(a q)+2 e^{-} \rightarrow \mathrm{Fe}(s) & E^{0}=-0.44 \mathrm{~V} \\
\mathrm{O}_{2}(g)+4 \mathrm{H}^{+}(a q)+4 e^{-} \rightarrow 2 \mathrm{H}_{2} \mathrm{O}(l) & E^{0}=+1.23 \mathrm{~V}
\end{array}
$$

a. Calculate the voltage for the standard cell based on the corrosion reaction. $2 \mathrm{Fe}(s)+\mathrm{O}_{2}(g)+4 \mathrm{H}^{+}(a q) \rightarrow 2 \mathrm{Fe}^{2+}(a q)+2 \mathrm{H}_{2} \mathrm{O}(l)$
b. Calculate the voltage if the reaction in Part a occurs at $\mathrm{pH}=4.00$ but all other concentrations are maintained as they were in the standard cell.
c. For the reaction $\mathrm{Fe}(\mathrm{OH})_{2}(s)+2 e^{-} \rightarrow \mathrm{Fe}(s)+2 \mathrm{OH}^{-}(a q), E^{0}=-0.88 \mathrm{~V}$. Use this information with one of the given standard potentials to calculate the $K_{\text {sp }}$ of $\mathrm{Fe}(\mathrm{OH})_{2}$.
d. An iron object may be protected from corrosion by coating it with tin. This method works well as long as the tin coating is intact. However, when the coating is penetrated, the corrosion of the iron is actually accelerated. Use electrochemical principles to account for both of these observations. The standard reduction potential for tin is:

$$
\operatorname{Sn}^{2+}(a q)+2 e^{-} \rightarrow \operatorname{Sn}(s) \quad E^{0}=-0.14 \mathrm{~V}
$$

5. ( $14 \%$ ) Write net equations for each of these reactions. Use appropriate ionic and molecular formulas for the reactants and products. Omit formulas for all ions or molecules that do not take part in a reaction. Write structural formulas for all organic substances. You need not balance the reactions. All reactions occur in aqueous solution unless otherwise indicated.
a. Solid calcium hydrogen carbonate is heated to a very high temperature.
b. Solid potassium sulfite is added to a solution of hydrochloric acid.
c. Solutions of barium hydroxide and sulfuric acid are mixed.
d. A tin(II) chloride solution is added to an acidic solution of potassium dichromate.
e. Concentrated hydrochloric acid is added to a solution of sodium hypochlorite.
f. Nitrogen-16 undergoes $\beta^{-}$decay.
6. $(13 \%)$ Answer these questions pertaining to chemical kinetics.
a. Determine the reaction rate at 10 seconds from the graph. Show your work.
b. Using the same units for the reaction rate as in Part a, and assuming concentrations in $\mathrm{mol} \cdot \mathrm{L}^{-1}$, give the units for the rate constant of a reaction with an order of:
i. zero
ii. one
iii. two
c. Consider this reaction: $4 \mathrm{HBr}(g)+\mathrm{O}_{2}(g) \rightarrow 2 \mathrm{H}_{2} \mathrm{O}(l)+2 \mathrm{Br}_{2}(g)$
i. Express the reaction rates for HBr and $\mathrm{Br}_{2}$ in this reaction relative to that of $\mathrm{O}_{2}$.

ii. Explain why this reaction is unlikely to occur by direct collision of four HBr molecules with one $\mathrm{O}_{2}$ molecule.
d. This mechanism has been suggested for the reaction in Part $\mathbf{c}$ :

$$
\begin{array}{ll}
\operatorname{HBr}(g)+\mathrm{O}_{2}(g) \rightarrow \operatorname{HOOBr}(g) & \text { Step 1 } \\
\operatorname{HOOBr}(g)+\operatorname{HBr}(g) \rightarrow 2 \mathrm{HOBr}(g) & \text { Step 2 } \\
\operatorname{HOBr}(g)+\operatorname{HBr}(g) \rightarrow \mathrm{H}_{2} \mathrm{O}(g)+\mathrm{Br}_{2}(g) & \text { Step 3 }
\end{array}
$$

Give the rate equation in terms of reactants expected for this reaction if the rate-determining step is:
i. Step 1
ii. Step 2
iii. Step 3

Assume in each case that the steps before the rate-determining step are in rapid equilibrium. Outline your reasoning in each case.
7. (13\%) A certain element, $\mathbf{X}$, forms the fluorides $\mathbf{X F}_{3}$ and $\mathbf{X F}_{5}$. Element $\mathbf{X}$ also reacts with sodium to form $\mathrm{Na}_{3} \mathbf{X}$.
a. Give the symbol of an element that behaves in this way.
b. For both $\mathbf{X F}_{3}$ and $\mathbf{X F}_{5}$;
i. write Lewis electron dot structures.
ii. describe the electron pair and molecular geometries.
iii. give the hybridization of the $\mathbf{X}$ atom.
c. The bonds in $\mathbf{X F}_{5}$ are not all the same length. Identify the longer bonds and account for this behavior.
d. Another element, $\mathbf{Y}$, in the same family as $\mathbf{X}$, forms $\mathbf{Y F}_{3}$ but not $\mathbf{Y F}_{5}$. Identify element $\mathbf{Y}$ and account for its inability to form $\mathrm{YF}_{5}$.
8. $(12 \%)$ Account for each observation with appropriate atomic or molecular properties.
a. Carbon dioxide has a higher vapor pressure than sulfur dioxide at the same temperature.
b. Hydrogen chloride has a lower normal boiling point than either hydrogen fluoride or hydrogen bromide.
c. Calcium oxide has a much higher melting point $\left(2580{ }^{\circ} \mathrm{C}\right)$ than potassium fluoride $\left(858{ }^{\circ} \mathrm{C}\right)$.
d. Tin(II) chloride is an ionic compound ( $\mathrm{mp}=240^{\circ} \mathrm{C}$ ) while tin(IV) chloride is a covalent compound ( $\mathrm{bp}=114{ }^{\circ} \mathrm{C}$ ).

## 2001 U. S. NATIONAL CHEMISTRY OLYMPIAD

## KEY for NATIONAL EXAM—PART II

1. a. $2 \mathrm{MnO}_{2}+\mathrm{As}_{2} \mathrm{O}_{3}+\mathrm{H}_{2} \mathrm{O} \rightarrow 2 \mathrm{Mn}^{2+}+2 \mathrm{AsO}_{4}^{3-}+2 \mathrm{H}^{+}$
b. i. $\quad 0.0750 \mathrm{~L} \times \frac{0.0125 \mathrm{~mol}}{\mathrm{~L}}=9.38 \times 10^{-4} \mathrm{~mol} \mathrm{As}_{2} \mathrm{O}_{3}$
ii. $\quad 0.01634 \mathrm{~L} \times \frac{2.28 \times 10^{-3} \mathrm{~mol}}{\mathrm{~L}}=3.73 \times 10^{-5} \mathrm{~mol} \mathrm{MnO}_{4}^{-}$
$3.73 \times 10^{-5} \mathrm{~mol} \mathrm{MnO}_{4}^{-} \times \frac{5 \mathrm{~mol} \mathrm{As}_{2} \mathrm{O}_{3}}{4 \mathrm{~mol} \mathrm{MnO}_{4}^{-}}=4.66 \times 10^{-5} \mathrm{~mol} \mathrm{As}_{2} \mathrm{O}_{3}$ left
iii. $\quad 9.38 \times 10^{-4}-4.66 \times 10^{-5}=8.91 \times 10^{-4} \mathrm{~mol} \mathrm{As}_{2} \mathrm{O}_{3}$ react with $\mathrm{MnO}_{2}$
$8.91 \times 10^{-4} \mathrm{~mol} \mathrm{As}_{2} \mathrm{O}_{3} \times \frac{2 \mathrm{~mol} \mathrm{MnO}_{2}}{1 \mathrm{~mol} \mathrm{As}_{2} \mathrm{O}_{3}}=1.78 \times 10^{-3} \mathrm{~mol} \mathrm{MnO}_{2}$
c. $\quad 1.78 \times 10^{-3} \mathrm{~mol} \mathrm{MnO}_{2} \times \frac{86.94 \mathrm{~g} \mathrm{MnO}_{2}}{\mathrm{~mol} \mathrm{MnO}_{2}}=0.155 \mathrm{~g} \mathrm{MnO}_{2}$
mass $\% \mathrm{MnO}_{2}=\frac{0.155 \mathrm{~g} \mathrm{MnO}_{2}}{0.225 \mathrm{~g} \mathrm{sample}} \times 100=68.9 \% \mathrm{MnO}_{2}$ in sample
d. The endpoint corresponds to a slight purple (pink) color due to excess $\mathrm{MnO}_{4}^{-}(a q)$.
2. a. Process responsible for $K_{1} \quad \mathrm{H}_{2} \mathrm{CO}_{3}(a q) \rightleftharpoons \mathrm{H}^{+}(a q)+\mathrm{HCO}_{3}^{-}(a q)$

Process responsible for $K_{2} \quad \mathrm{HCO}_{3}^{-}(a q) \rightleftharpoons \mathrm{H}^{+}(a q)+\mathrm{CO}_{3}{ }^{2-}(a q)$
b. i. $\quad K_{1}=\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{HCO}_{3}^{-}\right]}{\left[\mathrm{H}_{2} \mathrm{CO}_{3}\right]} \quad 4.2 \times 10^{-7}=\frac{\left[\mathrm{H}^{+}\right]^{2}}{(0.033)} \quad\left[\mathrm{H}^{+}\right]=1.2 \times 10^{-4} \quad \mathrm{pH}=3.93$
ii. $\quad\left[\mathrm{H}_{2} \mathrm{CO}_{3}\right]=\left[\mathrm{HCO}_{3}^{-}\right] \quad K_{1}=\left[\mathrm{H}^{+}\right] \quad\left[\mathrm{H}^{+}\right]=4.2 \times 10^{-7} \quad \mathrm{pH}=6.38$
iii. $\quad\left[\mathrm{HCO}_{3}{ }^{-}\right]=\left[\mathrm{CO}_{3}{ }^{2-}\right] \quad K_{2}=\left[\mathrm{H}^{+}\right] \quad\left[\mathrm{H}^{+}\right]=4.7 \times 10^{-11} \quad \mathrm{pH}=10.33$
iv. $\quad \mathrm{CO}_{3}^{2-}(a q)+\mathrm{H}_{2} \mathrm{O}(l) \rightleftharpoons \mathrm{HCO}_{3}^{-}(a q)+\mathrm{OH}^{-}(a q)$
$\left[\mathrm{OH}^{-}\right]=\sqrt{\frac{K_{w}}{K_{a}} \times\left[\mathrm{CO}_{3}{ }^{2}-\right]}$
$\left[\mathrm{OH}^{-}\right]=\sqrt{\frac{1.0 \times 10^{-14}}{4.7 \times 10^{-11}} \times 0.125}$
$\left[\mathrm{OH}^{-}\right]=\sqrt{2.7 \times 10^{-5}} \quad\left[\mathrm{OH}^{-}\right]=0.0052 \quad \mathrm{pOH}=2.28$
$\left[\mathrm{H}^{+}\right]=1.9 \times 10^{-12} \quad \mathrm{pH}=11.72$
c. $\quad \mathrm{pH}=7.40 \quad\left[\mathrm{H}^{+}\right]=4.0 \times 10^{-8} \quad$ Components of the best buffer: $\mathrm{H}_{2} \mathrm{CO}_{3}$ and $\mathrm{HCO}_{3}^{-}$
$4.2 \times 10^{-7}=4.0 \times 10^{-8} \times \frac{\mathrm{HCO}_{3}^{-}}{\mathrm{H}_{2} \mathrm{CO}_{3}} \quad \frac{\mathrm{HCO}_{3}^{-}}{\mathrm{H}_{2} \mathrm{CO}_{3}}=10.5$
d. $\frac{4.2 \times 10^{-7}}{2 \times 10^{-4}}=2 \times 10^{-3}$ or 0.002

Because the ratio of the two K values is $0.002,0.2 \%$ of dissolved $\mathrm{CO}_{2}$ is actually $\mathrm{H}_{2} \mathrm{CO}_{3}$.
3. a. $\quad \mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6}+6 \mathrm{O}_{2} \rightarrow 6 \mathrm{CO}_{2}+6 \mathrm{H}_{2} \mathrm{O}$
b. $\Delta G_{\text {metabolism }}^{o}=6 \Delta G_{C O_{2}}^{o}+6 \Delta G_{H_{2} O}^{o}-\Delta G_{C_{6} H_{12} O_{6}}^{o}$

$$
\begin{aligned}
& =6 \mathrm{~mol}\left(-394.4 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}\right)+6 \mathrm{~mol}\left(-237.2 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}\right)-\left(-917 \mathrm{~kJ} \cdot \mathrm{~mol}^{-1}\right) \\
& =-2366.4 \mathrm{~kJ}-1423.2 \mathrm{k} 917 \mathrm{~kJ} \\
& =-2873 \mathrm{~kJ}
\end{aligned}
$$

c. $\quad \Delta G^{o}=\Delta H^{o}-T \Delta S^{o}$
$-2873 \mathrm{~kJ}=-2801.3 \mathrm{~kJ}-29 \mathbf{K} \Delta S^{o} \quad\left(298 \mathrm{~K} \mathrm{~S}^{o}=72 \mathrm{~kJ} \quad \Delta S^{o}=0.24 \mathrm{~kJ} / \mathrm{K} \quad\right.$ or 240 JK
d. i. $\quad 1.0 \mathrm{~g} \mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6} \times \frac{1 \mathrm{~mol}}{180 \mathrm{~g}}=5.6 \times 10^{-3} \mathrm{~mol} \mathrm{C}_{8} \mathrm{H}_{12} \mathrm{O}_{6}$
$5.6 \times 10^{-3} \mathrm{~mol} \mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6} \times \frac{2872.6 \mathrm{~kJ}}{\mathrm{~mol}}=16 \mathrm{~kJ}$
$16 \mathrm{~kJ} \times \frac{1 \mathrm{~mol} \mathrm{ATP}}{30.5 \mathrm{~kJ}}=0.52 \mathrm{~mol} \mathrm{ATP}$ formed
ii. $\quad \Delta G^{o}=-R T \ln K \quad \frac{30.5 \times 10^{3} \mathrm{~J}}{\mathrm{~mol}}=\frac{-8.314 \mathrm{~J}}{\mathrm{~mol} \cdot \mathrm{~K}}(298 \mathrm{~K}) \ln K \quad \ln K=-12.31 \quad K=4.5 \times 10^{-6}$
4.

$$
\begin{aligned}
& \text { a. } \quad 2 \mathrm{Fe}(s) \rightarrow 2 \mathrm{Fe}^{2+}(a q)+4 e^{-} \quad E^{0}=+0.44 \mathrm{~V} \\

& \mathrm{Fe}(\mathrm{OH})_{2}(s) \rightleftharpoons \mathrm{Fe}^{2+}(a q)+2 \mathrm{OH}^{-}(a q) \quad E^{0}=-0.44 \mathrm{~V} \\
& \Delta G^{o}=-n F E^{o}=-R T \ln K_{s p} \\
& \ln K_{s p}=\frac{n F E^{o}}{R T} \quad \ln K_{s p}=\frac{(2 \mathrm{~mol})\left(96,500 \mathrm{~N}^{-1}\right)(-0.44 \mathrm{~V})}{\left(8.314 \mathrm{~J} \mathrm{~mol}^{-1} \cdot \mathrm{~K}^{-1}\right)(298 \mathrm{~K})}=-34.28 \quad K_{s p}=1.30 \times 10^{-15}
\end{aligned}
$$

d. When iron is coated with Sn , the reaction $\mathrm{Sn} \rightarrow \mathrm{Sn}^{2+}+2 e^{-}$takes place. If the tin coating is broken, the reaction $\mathrm{Sn}^{2+}+\mathrm{Fe} \rightarrow \mathrm{Sn}+\mathrm{Fe}^{2+}$ becomes spontaneous. Iron becomes the anode and is oxidized more readily.
5. Note: Balanced equations were not required.
a. $\mathrm{Ca}\left(\mathrm{HCO}_{3}\right)_{2} \rightarrow \mathrm{CaO}+\mathrm{H}_{2} \mathrm{O}+2 \mathrm{CO}_{2}$ (partial credit for $\mathrm{CaCO}_{3}$ )
b. $\quad \mathrm{K}_{2} \mathrm{SO}_{3}+\mathrm{H}^{+} \rightarrow \mathrm{K}^{+}+\mathrm{H}_{2} \mathrm{O}+\mathrm{SO}_{2}\left(\right.$ partial credit for $\left.\mathrm{H}_{2} \mathrm{SO}_{3}\right)$
c. $\mathrm{Ba}^{2+}+\mathrm{OH}^{-}+\mathrm{H}^{+}+\mathrm{SO}_{4}^{2-} \rightarrow \mathrm{H}_{2} \mathrm{O}+\mathrm{BaSO}_{4}$
d. $\mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}+\mathrm{Sn}^{2+}+\mathrm{H}^{+} \rightarrow \mathrm{Cr}^{3+}+\mathrm{Sn}^{4+}+\mathrm{H}_{2} \mathrm{O}$ (partial credit for $\mathrm{SnCl}_{4}$ )
e. $\mathrm{H}^{+}+\mathrm{Cl}^{-}+\mathrm{OCl}^{-} \rightarrow \mathrm{Cl}_{2}+\mathrm{H}_{2} \mathrm{O}$ (partial credit for HClO )
f. $\quad{ }_{7}^{16} \mathrm{~N} \rightarrow{ }_{-1}^{0} \beta+{ }_{8}^{16} \mathrm{O}$
6. a. Tangent to curve at 10 seconds: $\frac{\Delta \mathrm{M}}{\Delta T}=\frac{-0.39 \mathrm{M}}{32 \mathrm{~s}}=-0.012 \mathrm{M} \cdot \mathrm{s}^{-1}$
b. i. $\quad$ rate $=k \quad$ units are $\mathrm{M}^{-1}$
ii. $\quad$ rate $=k[] \quad$ units are $\mathrm{s}^{-1}$
iii. $\quad$ rate $=k[]^{2} \quad$ units are $\mathrm{M}^{-1} \cdot \mathrm{~s}^{-1}$
c. i. Expressed in symbols: $\frac{-d\left[\mathrm{O}_{2}\right]}{d \mathrm{t}}=\frac{-d[\mathrm{HBr}]}{4 d \mathrm{t}}=\frac{d\left[\mathrm{~B} r_{2}\right]}{2 d \mathrm{t}}$

This shows that the rate of disappearance of HBr is 4 times that of $\mathrm{O}_{2}$ and the rate of production of $\mathrm{Br}_{2}$ is twice the rate of disappearance of $\mathrm{O}_{2}$.
ii. More than mono- or bi-molecular steps improbable.
d. i. rate $=k[\mathrm{HBr}]\left[\mathrm{O}_{2}\right] \quad$ Rate is proportional to reactants in the rate-limiting step.
ii. $\quad$ rate $=k[\mathrm{HBr}]^{2}\left[\mathrm{O}_{2}\right] \quad[\mathrm{HOOBr}]$ in the rate equation must be stated in terms of the previous equilibrium.
iii. rate $=k[\mathrm{HBr}]^{2}\left[\mathrm{O}_{2}\right]^{1 / 2} \quad[\mathrm{HOBr}]$ in the rate equation must be stated in terms of the previous equilibria.
7. a. Phosphorus (P) and arsenic (As) might behave in this manner.

ii. $\quad \mathbf{X F}_{3} \quad$ Electron pair geometry is tetrahedral; atom geometry is trigonal pyramidal.
$\mathrm{XF}_{5} \quad$ Electron pair geometry and atom geometry are both trigonal bipyramidal.
iii. $\quad \mathbf{X F}_{3} \quad \mathbf{X}$ is $\mathrm{sp}^{3}$ hybridized.
$\mathbf{X F}_{5} \quad \mathbf{X}$ is $\mathrm{dsp}^{3}$ hybridized.
c. Axial bonds in $\mathrm{XF}_{5}$ are longer than the equatorial bonds. The axial bonds are $p / d$ hybrids and the equatorial bonds are $s / p^{2}$ hybrids. Another acceptable explanation is that the axial bonds at $90^{\circ}$ are repelled more than the equatorial bonds at $120^{\circ}$.
d. $\quad \mathrm{Y}$ could be $\mathrm{N} ; \mathrm{N}$ has no $d$ orbitals. Another acceptable explanation is that N is too small to accommodate five F atoms.
$\mathbf{Y}$ could be Bi; Bi can't easily be oxidized to +5 .
8.
a. $\quad \mathrm{CO}_{2}$ is linear and therefore nonpolar. $\because^{\circ \circ} \mathrm{O}=\mathrm{C}=\stackrel{\circ}{\mathrm{O}} \stackrel{\square}{\bullet}$
$\mathrm{SO}_{2}$ is bent and therefore polar.
The polar substance will bond more strongly and have the lower vapor pressure.
b. The boiling point of HCl is less than the boiling point of HF because HF forms hydrogen bonds which are harder to break than van der Waals forces.
Both HCl and HBr are attracted by van der Waals forces. However, HBr has more electrons and therefore has stronger van der Waals forces. As a result, the boiling point of HCl is less than the boiling point of HBr .
c. $\quad \mathrm{Ca}^{2+}$ and $\mathrm{O}^{2-}$ ions are attracted about four times as strongly as $\mathrm{K}^{+}$and $\mathrm{F}^{-}$ions. Ions with $\mathrm{a}+2$ charge are attracted more strongly than ions with a +1 charge. In addition, the calcium-to-oxygen distance is less than the potassium-to-fluoride distance, leading to an increased force of attraction for the shorter bond.
d. Tin(II) chloride is ionic. Tin(IV) chloride is covalent. The +4 charge on tin causes it to attract electrons more strongly from chloride ion, making the bonds covalent.
